

Necrotic Ring Spot is a very pervasive & damaging disease that can turn a healthy & vigorous lawn into an eyesore of dead & dying rings that may take years to recover, if ever.

Even though there is **"no cure"** for necrotic ring spot, there are several ways to help **"contain"** the spread of this disease.

The first & most important way to help minimize the impact of necrotic is to get your lawn to its **healthiest state possible.** This can be achieved by continually **fertilizing your lawn using organic materials.** Organic nutrients produce microbes in the soil that help contain necrotic activity. Also, maintaining proper mowing height is extremely important, as

Necrotic Ring Spot

mowing too short or letting the lawn get long then cutting it all off at one time, puts your lawn under extreme stress, which causes the necrotic to thrive. **Properly watering your lawn.** on a consistent basis is also very important.

Aerating twice a year is vital to help reduce compaction, while providing increased air flow to the root zone, thereby reducing stress to the lawn.

Overseeding with a **necrotic resistant seed** will help increase turf density of resistant

grass types, helping fight the spread of this disease.

These treatments **must be done annually** to achieve the healthiest lawn possible. **A Natural Solution** technician will put together a treatment program that is right for your property.
